Koushik C.

MBA (Operations), Business Analytics Minor — Targeting Operations & Analyst Roles

Bengaluru, India | +91 82772 73661 | chunchukoushik232@gmail.com | linkedin.com/in/koushik-c | github.com/koushik2302 | portfolio-koushik-c.vercel.app

EDUCATION

Master of Business Administration Sep 2025 – Sep 2027

PES University, Bengaluru — Major: Operations, Minor: Business Analytics

CGPA: 8.09/10. Coursework: Production & Operations Management, Supply Chain, Business Analytics, Statistics, Managerial Economics, Financial Accounting.

B.E., Computer Science & Engineering 2020 – 2024

Nitte Meenakshi Institute of Technology, Bengaluru

EXPERIENCE

Storage Engineer Oct 2024 – Jul 2025

Hewlett Packard Enterprise (HPE)

- Ran an L1/L2 incident queue for 50+ enterprise customers worldwide — triaged by severity and business impact, closed within SLA across time zones.
- Handled 20+ tickets at once during peak load, juggling prioritisation, escalation routing, and stakeholder updates in parallel.
- Chased actual root causes on recurring infrastructure failures instead of just patching symptoms, which brought down the repeat-ticket rate.

PROJECTS

Inventory Optimization — ABC-XYZ Safety-Stock Policy at Scale 2026

Independent Research · Python, SQL, DuckDB · github.com/koushik2302/inventory-optimization

- Classified 166,720 product-store combinations via ABC-XYZ analysis across the full Corporación Favorita dataset (125.5M transaction rows, 54 stores, 2013–2017), computing differentiated safety-stock policies.
- Found that differentiated inventory policies, assumed costlier at small scale (+20.7% on a 575 SKU-store sample), actually turn out 1.14% cheaper at full scale — the savings hide in the long tail of low-value, erratic-demand items invisible in smaller samples.
- Rebuilt the pipeline (load, classify, safety stock, promotion/holiday analysis) to run on the full dataset in under a minute, down from ~90 minutes, using indexing, early-exit guards, and DuckDB for the heaviest aggregations.

Service Queue Simulation — Staffing, SLA Policy & the Utilisation Cliff 2026

Independent · Python (SimPy), JavaScript · github.com/koushik2302/queue-sim

- Built a discrete-event simulation of a multi-tier support queue (non-stationary Poisson arrivals, lognormal service times, 4 severity tiers, 4 scheduling policies) to find the point where SLA compliance actually falls apart.
- Found that priority scheduling protects critical tickets while quietly wrecking the low-priority ones — at 95% utilisation, S1 waits stayed around 0.14h while S4's p95 wait hit 6.3 hours, even though the SLA dashboard still read 97% green. Validated the engine against the Erlang-C closed form first (23/24 checks inside the 95% CI).

Predicting Mental-Health Treatment Seeking in Tech 2024

Capstone · Python, scikit-learn, Flask · github.com/koushik2302/mental-health-prediction

Compared SVM, Random Forest, Decision Tree, and a stacked ensemble on 1,259 survey responses (26 features); reported honestly that the stacked ensemble (0.83) didn't beat the plain SVM baseline (0.85).

SKILLS

Operations Process improvement, root-cause analysis, capacity & staffing planning, SLA and incident management, queueing theory, supply chain fundamentals, inventory management

Analytics Discrete-event simulation, regression, forecasting, hypothesis testing, sensitivity analysis, A/B reasoning, ABC-XYZ classification

Technical Python (pandas, NumPy, SciPy, SimPy, scikit-learn), SQL, DuckDB, Advanced Excel, JavaScript, Git

Tools Jira, Confluence, ServiceNow, Matplotlib, Chart.js

CERTIFICATIONS

- Lean Six Sigma: Green Belt Fundamentals — Alison (CPD Certified), 2026
- Enterprise Risk Management, Level 1 Course — Institute of Risk Management (course completion), 2026
- Advanced Software Engineering Job Simulation — Walmart USA via Forage
